HelpDesk Support Ticket Project: Comprehensive Dashboard Report

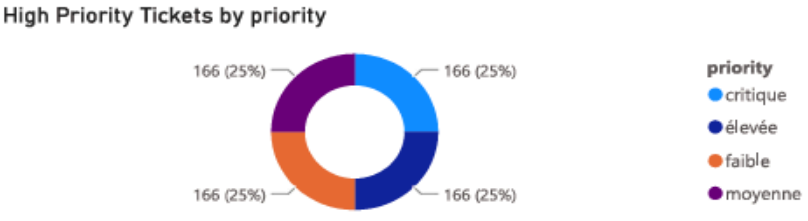

1. Executive Summary & Core Metrics

- **Volume Overview:** The system processes an average of **5.50 tickets per day**, with an average daily resolution rate of **1.96 solved tickets per day**.

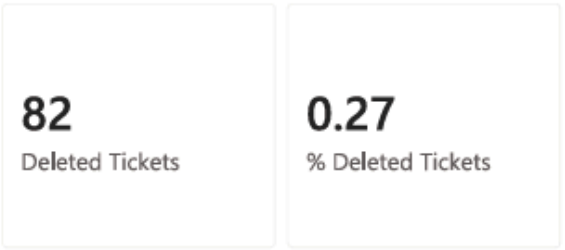

- **Priority Distribution:** High-priority tickets total **166 items**, perfectly split evenly across the priority tiers (*critique*, *élevée*, *moyenne*, and *faible*), each accounting for **25% (166 tickets each)**.

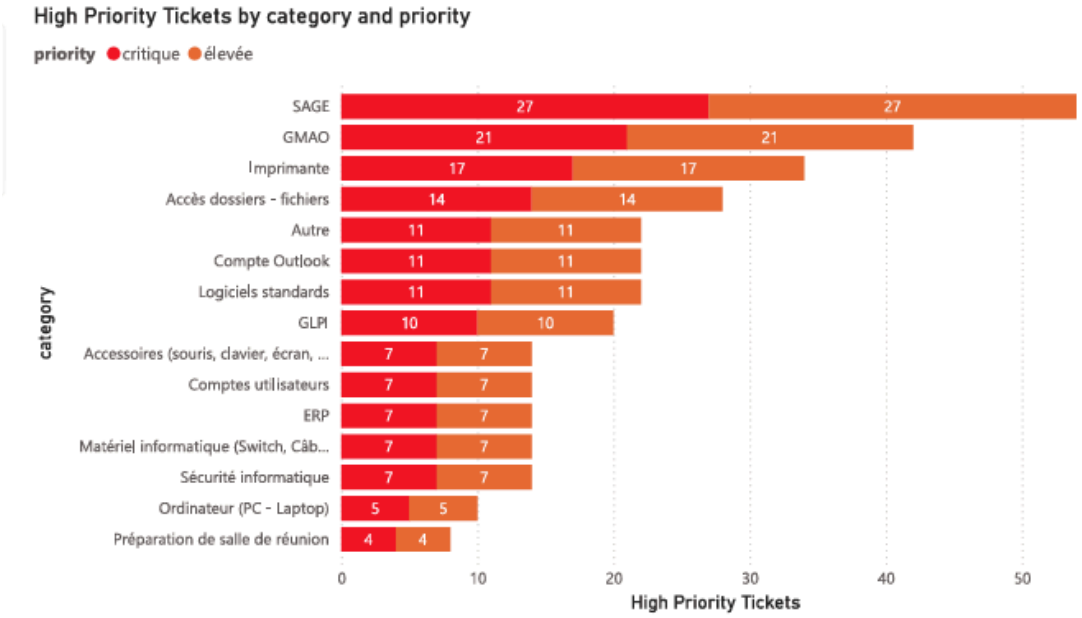

- **Deletion & System Health:** Total deleted tickets stand at **82**, representing **0.27%** of the tracking pool.

2. High-Priority Ticket Breakdown by Category
High-priority issues are heavily concentrated in core operational software and hardware maintenance:

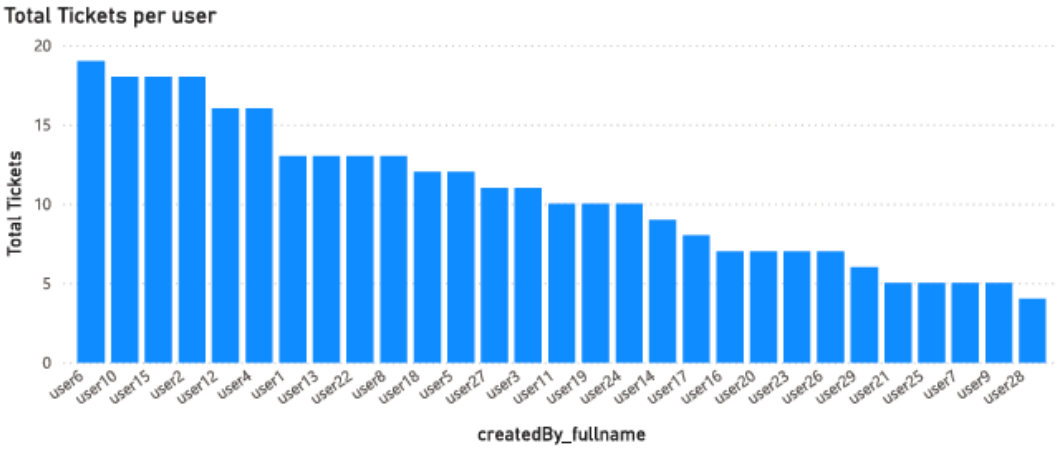

- **SAGE:** Leads with **27** high-priority tickets.
- **GMAO:** Follows closely with **21** high-priority tickets.
- **Imprimante (Printers):** Accounts for **17** high-priority issues.
- **Accès dossiers - fichiers:** Records **14** high-priority tickets.
- **Autre, Compte Outlook, and Logiciels standards:** Tie with **11** tickets each.
- **GLPI:** Registers **10** high-priority tickets.
- **Accessoires, Comptes utilisateurs, ERP, Matériel informatique, & Sécurité informatique:** Each record **7** tickets.
- **Ordinateur (PC - Laptop):** Accounts for **5** tickets.

- **Préparation de salle de réunion:** The lowest category, with **4** high-priority tickets.

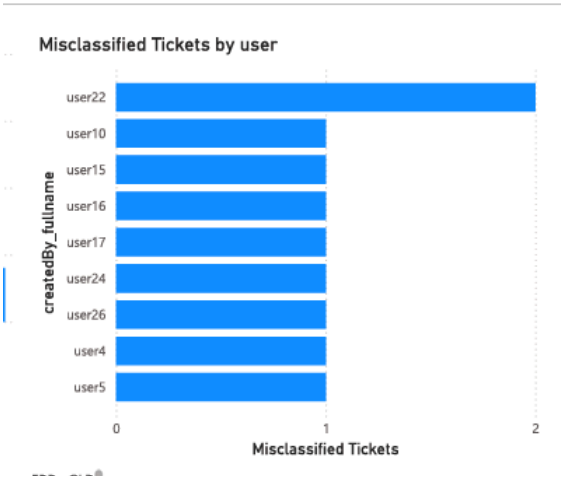

3. User Activity, Misclassifications, and Deletions

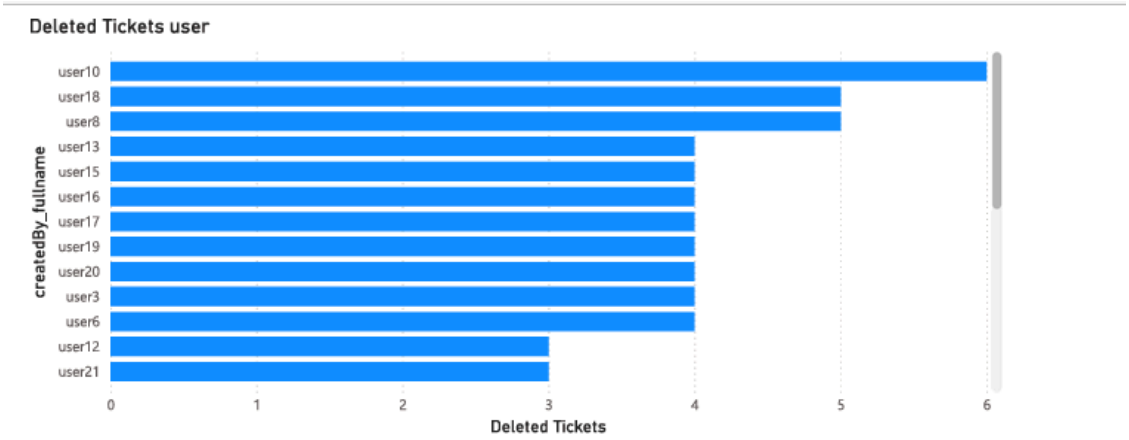

- **Ticket Generation Volumes:** Active users such as **user6**, **user10**, and **user15** generate the highest overall ticket counts (ranging between **15 to 20 tickets** each).

- **Misclassified Tickets:** Users including **user22**, **user10**, **user15**, **user16**, **user17**, **user24**, **user26**, **user4**, and **user5** register highlighted misclassification counts. Specific category distributions show heavy activity in *Accès dossiers - fichiers* (**25 total**) and *Autre* (**24 total**).

- **Deleted Tickets by User: user10** leads deletions with **6** removed tickets, followed by **user18** and **user8** with **5** deleted tickets each.

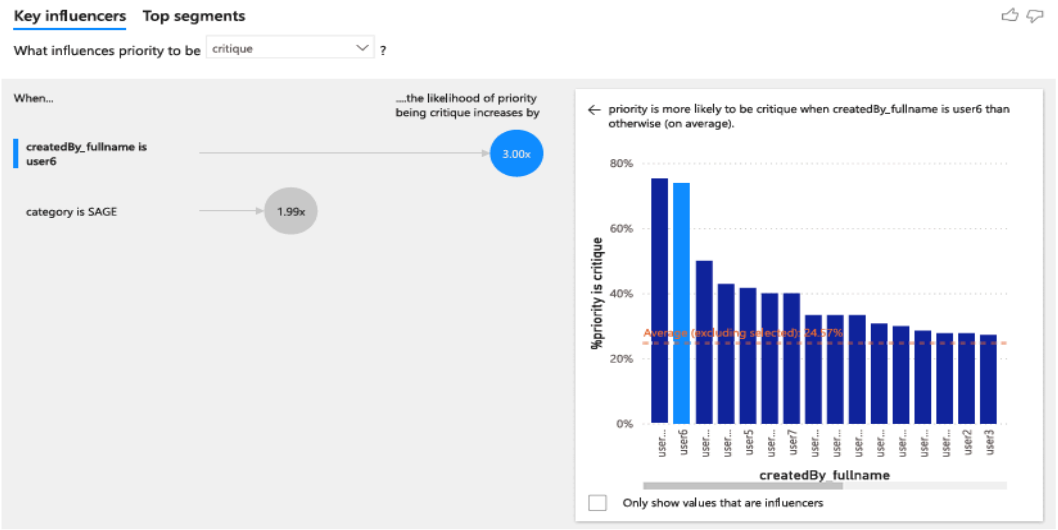

4. Key Influencers & Priority Drivers

- **Critical Priority Drivers:** Analytical modeling indicates that when **createdBy_fullname is user6**, the likelihood of a priority being *critique* increases by **3.00x**.

- **Category Influence:** When the ticket **category is SAGE**, the likelihood of a priority being *critique* increases by **1.99x**.

- **User Trend:** Across the user base, **user6** exhibits the highest percentage propensity for generating *critique*-level priorities (surpassing **80%** of their submitted pool).

Conclusion & Key Recommendations

Based on the dashboard analysis, while the HelpDesk system maintains a steady workflow, several targeted operational and systemic improvements are recommended:

1. **Address Key Bottlenecks (SAGE & GMAO):** Since **SAGE** and **GMAO** represent the largest sources of high-priority tickets—with SAGE increasing the likelihood of a critical ticket by **1.99x**—prioritizing technical maintenance, targeted end-user training, and system optimization for these two platforms will significantly reduce overall high-severity incidents.
2. **Standardize Prioritization & User Behavior:** Specific users, notably **user6**, show a high propensity for flagging tickets as *critique* (**3.00x increase in likelihood**). Implementing clearer ticket-severity guidelines and standard operating procedures (SOPs) for user submissions will help prevent ticket escalation bias and improve resource allocation.
3. **Improve Initial Ticket Classification:** Misclassification across categories (particularly within *Accès dossiers - fichiers* and *Autre*) indicates a need for better-defined dropdowns or auto-routing rules in GLPI/HelpDesk to ensure tickets reach the appropriate support team faster.
4. **Enhance Resolution Rate & Audit Deletions:** With an average creation rate of **5.50 tickets/day** compared to a resolution rate of **1.96 tickets/day**, the current backlog may grow over time. Increasing daily resolution throughput and conducting periodic audits on deleted tickets (e.g., top deleted ticket logs for user10 and user18) will help maintain data integrity and support ticket SLA compliance.
